

What is GW1516?

GW1516 is a type of research drug that scientists are studying to see if it can help with weight loss and metabolic disorders. It works by activating a specific receptor in the body called GPR40, which helps to control things like insulin levels and glucose uptake. Studies in animals have suggested that GW1516 may be able to increase energy expenditure and improve insulin sensitivity, which could lead to weight loss.

What you need to know:

It is important to note that these studies were done in animals and more research is needed to understand if GW1516 is safe and effective in humans.

Indications:

- Weight loss
- Aid in diabetes
- Improve athletic performance
- Control insulin and glucose

PATIENT BENEFIT:

**WEIGHT
LOSS**
